

Elevator Pitch

Adaptive Fitness Intelligence — National AI Challenge

Prepared by Manus AI · 20 August 2026

1 Five-sentence elevator pitch

Adaptive Fitness Intelligence is a non-clinical decision-support layer for people who take training seriously but currently manage their readiness in one app, nutrition in another and progressive overload in a ~~notes file~~. It imports consented biometric trends, captures the full structure of a training block—from split and movement to sets, reps, load and RPE—and remembers the previous successful session so progression is visible at the point of logging. Instead of declaring that a person is simply “recovered” or “not recovered”, it compares within-person changes in sleep, HRV/RHR, nutrition adherence and completed training dose against the user’s stated goal. It then recommends an explainable next action, such as maintain load, reduce top-set RPE, repeat last session, or add a small progression, while showing the evidence and uncertainty behind the suggestion. The first product is deliberately narrow: an iOS/Apple Health and WHOOP import path, rapid strength logging with prior-session ghost sets, nutrition CSV/import fallback, and a 12-week validation cohort of regular lifters.

1.1 Why timing is credible

Sport Ireland reported 1.97 million adults regularly participating in sport in 2023, while 94% of Irish households had internet access in 2024. [1] [2] IDC forecast 537.9 million wearable shipments worldwide in 2024. [3] These figures demonstrate infrastructure and behaviour, not confirmed willingness to pay; that must be earned through the initial cohort.
