

Unique Selling Point

Adaptive Fitness Intelligence — National AI Challenge

Prepared by Manus AI · 20 August 2026

1 Unique selling point

A goal-aware training-context engine that links biometric trends to structured strength blocks and set-level RPE/RIR—not merely another proprietary readiness score—and displays the evidence behind every recommendation.

1.1 What is different

WHOOOP provides recovery, strain, sleep and workout data through permissioned scopes. [1] Apple HealthKit can act as a permissioned, multi-source health and fitness repository. [2] Cronometer connects nutrition with a broad set of activity and wearable sources. [3] Strength products such as Strong and Hevy validate demand for low-friction logging, history, RPE/notes and progression. [4] [5]

The opportunity is the **join**. Existing product material shows rich components but not a documented neutral decision layer that links a block's intended stimulus to completed set-level work, recovery trends, nutrition context and a reasoned next action. This is a positioning hypothesis based on product scope, not proof of willingness to pay.

1.2 Defensible interaction, not unverified algorithm

Element	Why it matters
Structured blocks	The system knows whether a user is in a strength, hypertrophy or deload phase.
Ghost sets	Prior relevant sets appear muted beside today's log, making progressive overload visible at the action moment.
Explainable recommendations	Every "maintain", "repeat", "reduce" or "progress" action names driving signals and confidence.
Device-normalised trends	Compare a user to their own repeated measurements rather than implying a universal HRV threshold.

1.3 Critical caveat

The USP becomes durable only if the product earns proprietary **behavioural** evidence: recommendation, rationale, follow-through and subsequent outcome. API access alone is not a moat. Nor should the app promise to write lifting data back to update WHOOOP strain; the public material reviewed shows read scopes, so that claim needs a separately confirmed partner pathway.
