

Training Ledger — Pitch Deck

National AI Challenge 2026 | AI & Agents

Slide 1: Hook

Your readiness score doesn't know yesterday's deadlifts.

Every serious lifter manages recovery in one app, nutrition in another, and progressive overload in a notes file. No product connects these three worlds — until now.

Training Ledger: The AI agent that turns scattered fitness data into one explainable training decision.

Slide 2: The Problem

Athletes are the integration layer.

- 537.9 million wearables shipped globally in 2024 (IDC). Ireland has 1.97 million regular sport participants (Sport Ireland).
- Recovery scores are opaque and disconnected from what you actually did in the gym.
- Progressive overload decisions are made from memory, not data.
- No product preserves the workout-level context — sets, load, reps, RPE, block goal — needed to make a recommendation understandable.

Root cause: Data lives in separate silos with different schemas, permissions, and objectives. The user becomes the manual reconciliation engine.

Slide 3: The Solution

One canonical training ledger. One explainable daily decision.

Training Ledger ingests consented wearable data (HRV, RHR, sleep, strain), nutrition logs, and structured strength records (block → split → movement → set → load × reps @ RPE) into a single system of record.

Before each session, it answers one question: **“Given your goal, completed work, and recovery context — what should you do today, and why?”**

Key features:

- Ghost sets: grey prior-session inputs beside today's editable fields
 - Evidence card: every recommendation shows its source signals, confidence, and counterfactual
 - Consent-first: granular permission for every data source
-

Slide 4: How the Agents Work

9 specialized autonomous agents. One approval-gated pipeline.

Agent	Role	AI Model
Trigger Router	Event intake & deduplication	None (deterministic)
Consent Gatekeeper	Permission verification	None (deterministic)
Data Normalizer	Provider-agnostic transformation	GPT-4o-mini (parsing only)
Context Assembler	Decision snapshot builder	None (deterministic)
Policy Evaluator	Safety & eligibility gate	None (deterministic)
Reasoning Engine	AI-powered proposal drafting	GPT-4o (temp 0.3, strict JSON)
Approval Gate	Human-in-the-loop decision	GPT-4o-mini (notification only)
Execution Agent	Session preparation	None (deterministic)
Outcome Recorder	Decision history logger	None (deterministic)

Key design principle: Only 1 of 9 agents uses a frontier LLM for reasoning. Deterministic policy runs BEFORE and AFTER the model. The agent cannot bypass safety rules. Nothing changes without human approval.

Framework: OpenAI Agents SDK + Inngest durable workflows (TypeScript-first, serverless, native human-in-the-loop).

Slide 5: Market — Ireland First

Beachhead: serious recreational lifters with wearables in Ireland.

Layer	Size	Revenue @ €99/yr
Ireland TAM (regular sport participants)	1.97M	€195M
Ireland SAM (15% power-user subset)	295,500	€29.3M
Initial cohort target (1% of SAM)	3,000	€292K ARR

Why Ireland first: High sport participation, strong wearable adoption, GDPR-compliant from day one, English-speaking expansion path to UK/US/AU/NZ (15.1M serviceable users, €1.5B directional TAM).

Pricing: €99/year — positioned between Hevy Pro (€24) and WHOOP One (€199).

Slide 6: Traction & Demo

What we’ve built in two weeks:

- Complete agentic architecture: 9 agents with typed tool contracts, starter prompts, and handoff protocols
- Production serverless blueprint: Next.js + Expo + Supabase + Inngest + OpenAI Agents SDK
- Working showcase website with live deployment
- Full ecosystem catalogue: 76+ supported wearables, nutrition apps, FODMAP/diabetic/allergy accommodations
- Evidence-based market validation with reproducible sizing model

Demo moment: Paste a workout from your notes → parser structures it instantly → ghost sets appear from last session → agent proposes “repeat top set, HRV below baseline, confidence moderate” → you approve or override → outcome recorded.

Slide 7: Business Model

Subscription SaaS with coach expansion.

Tier	Price	Target
Athlete (core)	€99/year	Individual lifters with wearables
Coach workspace	€199/year per coach + €49/athlete	Personal trainers managing 5-20 athletes
API/data partnerships	Revenue share	Wearable brands wanting training context

Unit economics: Serverless infrastructure scales to zero. Primary cost is LLM inference (~€0.02 per decision run). At 3,000 users × €99 = €297K ARR with <€30K infrastructure cost.

Moat: Accumulated decision-outcome data (what was proposed, what was done, what happened) creates a unique training-context dataset no competitor has.

Slide 8: Go-to-Market

Phase 1 (Months 1-6): Validate with 300 design partners in Ireland.

- Recruit from CrossFit boxes, powerlifting clubs, and WHOOP/Garmin communities
- Free beta with commitment to 12-week logging and feedback
- Track: consent rate, weekly logging, retention, advice-following, trust score

Phase 2 (Months 6-12): Convert to paid.

- Launch €99/year subscription for validated cohort
- Add coach workspace for personal trainers
- Expand Apple Watch + Garmin integrations

Phase 3 (Months 12-18): Scale English-speaking markets.

- UK, US, Australia, New Zealand
 - Partnership discussions with wearable brands
 - Enterprise wellness pilot conversations
-

Slide 9: Team

LeMente AI & Data-Driven Fitness Expert

- Deep domain expertise: lives the problem daily (structured training blocks, wearable data, nutrition tracking)
- Technical capability: AI systems, data analytics, autonomous agent architecture
- Unfair advantage: understands both the technology AND the user because they are the user

"The best businesses won't come from people chasing AI trends — they'll come from people who already understand real-world problems, and now finally have tools powerful enough to solve them." — Sean Blanchfield, 2025 National AI Challenge keynote

Slide 10: The Ask

What we need to win:

1. **Validation:** Access to 30-40 problem interviews with serious Irish lifters
2. **Pilot partners:** 2-3 gyms or coaching businesses for the 12-week cohort
3. **Enterprise Ireland support:** HPSU feasibility funding for the consent-first MVP
4. **Mentorship:** Connections to wearable platform partner programmes (WHOOP, Garmin)

What judges get: A wildcard entry that demonstrates exactly what this challenge is about — an autonomous agent system solving a real problem for a real user, with responsible AI governance baked in from day one, built by someone who lives the problem every single day.

Training Ledger. The training context wearables are missing.

Training Ledger — 4-Minute Pitch Script

National AI Challenge 2026 | Hub Showcase, 14 September

[Walk to centre. Pause. Make eye contact.]

I trained legs yesterday. Squats, Romanian deadlifts, leg press. I know exactly what I lifted, what RPE I hit, and how many sets I ground through.

This morning, my WHOOP told me my HRV is twelve percent below baseline. My sleep score was 64. And my recovery is in the yellow.

So here's my question: should I push my bench press today, or repeat last week's weight?

WHOOP doesn't know. It has no idea what I did yesterday. It doesn't know I'm in week six of a hypertrophy block. It doesn't know my nutrition was off for three days. And it definitely doesn't know that my last bench session finished at RPE nine.

I have all that information. It's just scattered across five different apps and a notes file on my phone.

[Pause.]

That's the problem. And I'm not alone.

Ireland has nearly two million regular sport participants. Wearable shipments hit 538 million globally last year. The data exists. The devices exist. But nobody connects recovery signals to what you actually did in the gym — at the level of sets, reps, load, and effort.

Your readiness score doesn't know yesterday's deadlifts.

[Beat.]

Training Ledger fixes that.

It's an autonomous AI agent system — nine specialized agents in a consent-first pipeline — that unifies your wearable recovery data, your nutrition logs, and your structured training records into one canonical ledger. And before each session, it answers one bounded question: given your goal, your completed work, and your recovery context, what should you do today — and why?

Not a magic number. Not a vague “you’re recovered.” An explainable recommendation that shows you the evidence, the confidence level, and what would happen if you did the opposite.

[Gesture to slides if available.]

Here's what makes this genuinely agentic — and why it fits this year's theme.

Nine agents. Only one uses a frontier AI model. The other eight are deterministic. A policy evaluator runs before the reasoning engine touches your data — it cannot bypass safety rules. A consent gatekeeper verifies permissions before any data flows. And critically, nothing changes your session without your explicit approval. The agent proposes. You decide.

That's not a chatbot with a fitness skin. That's a production-grade autonomous workflow with human accountability at every action boundary.

[Shift tone — commercial.]

The market is real. We're targeting serious recreational lifters in Ireland first — people who already own a WHOOP or Apple Watch and follow structured training blocks. Our serviceable market is roughly 295,000 people in Ireland alone. At ninety-nine euro a year — positioned between Hevy Pro at twenty-four and WHOOP at one-ninety-nine — we need just three thousand paying users for meaningful revenue.

The expansion path is English-speaking markets: UK, US, Australia, New Zealand. Fifteen million serviceable users. Same language, same wearable ecosystem, same training culture.

[Lean in.]

Our moat isn't the code. Anyone can build a dashboard. Our moat is the decision-outcome dataset. Every time an athlete accepts or overrides a recommendation, and then records what actually happened — that's training-context data that no wearable company, no food app, and no gym tracker has ever collected together. Over time, that makes our recommendations better in a way competitors cannot replicate without building the same consent-first pipeline from scratch.

[Personal.]

I built this because I am the user. I track my blocks, my splits, my sets. I wear the devices. I log the food. And every morning I do the mental maths that this system automates. The keynote last year said the best AI businesses come from people who understand real-world problems and now have tools powerful enough to solve them. This is that.

[Close — direct to judges.]

Training Ledger is a wildcard entry. It's not on the curated list. But it hits every criterion this challenge asks for: a real user, a credible buyer, a multi-step agentic workflow with observe-act-remember-verify-escalate, responsible data governance, and a meaningful path from prototype to product.

What I need next: thirty problem interviews, two pilot gyms, and a conversation with Enterprise Ireland about HPSU feasibility funding.

What you get: proof that the AI and Agents theme isn't just for enterprise finance and insurance. It's for the two million Irish people who train — and deserve better tools than a spreadsheet and a gut feeling.

Training Ledger. The training context wearables are missing.

Thank you.

[Nod. Step back.]

Timing notes: Approximately 3 minutes 50 seconds at natural speaking pace (140 wpm). Leaves 10 seconds for settling and applause. *** Add File: /home/ubuntu/ai-fitness-intelligence-report/analysis/competitive_score.md

Competitive Assessment — Training Ledger vs TechIreland National AI Challenge Field

Scoring Methodology

Each entry is scored on seven dimensions aligned with the official judging criteria and the 2025 keynote philosophy. Each dimension is scored 1-10.

Dimension	Weight	What judges look for
Agentic Design	20%	Multi-step workflow, memory, escalation, human-in-the-loop
Technical Depth	15%	Architecture quality, production-readiness, not just a wrapper
Problem Clarity	15%	Named user, quantified cost, root cause not symptom
Commercial Viability	15%	Buyer, pricing, route to revenue
Responsible AI	10%	Governance, consent, explainability, safety boundaries
Demo Impact	15%	“Wow” moment, end-to-end workflow visible in 3 minutes
Domain Expertise	10%	“Do what you know” — founder lives the problem

Training Ledger Score

Dimension	Score	Justification
Agentic Design	9/10	9-agent pipeline with typed handoffs, durable workflows, approval gates, deterministic policy before/after model. Textbook agentic architecture.
Technical Depth	8/10	Full production blueprint (serverless, TypeScript, Supabase, Inngest, OpenAI SDK). Not a thin wrapper — only 1/9 agents uses an LLM. Architecture diagrams, state machine, tool contracts all specified.
Problem Clarity	8/10	Clear user (serious lifters), quantified (1.97M Irish sport participants, 538M wearables), root cause identified (data silos, missing training context). Slightly weaker: no single enterprise buyer.
Commercial Viability	7/10	€99/year subscription with clear positioning. Coach tier adds B2B. But B2C is harder to prove in 2 weeks than B2B enterprise. No LOI or pilot commitment yet.
Responsible AI	9/10	Consent-first design, GDPR Article 9 awareness, non-clinical boundary, policy-before-model, prohibited claims registry, data minimisation, audit trail. Exceptional for a hackathon entry.
Demo Impact	7/10	Notes-to-structured-session parser + ghost sets + evidence card is compelling. But no live wearable data flowing in demo (API keys needed). Mock data demo is strong but not visceral.
Domain Expertise	10/10	Founder IS the user. Tracks blocks, wears devices, logs food, does the manual reconciliation daily. This is the “do what you know” unfair advantage the 2025 keynote described.

Weighted Total: 8.3 / 10

Comparison with Previous Winners

Entry	Year	Agentic	Technical	Problem	Commercial	Responsible AI	Demo	Domain	Weighted
Training Ledger	2026	9	8	8	7	9	7	10	8.3
Bias Busters	2024	4	6	7	4	10	6	7	6.0
HandSpeak AI	2025	5	7	8	5	7	9	7	6.7
LaunchLoop	2025	7	7	7	7	6	7	6	6.8
LibertyLumens	2025	6	6	7	6	7	7	6	6.4

Context Notes

- 2024 was pre-agents era. Bias Busters won with ethical AI focus — no agentic workflow expected. The bar has risen dramatically.

- **2025 introduced agentic thinking** but most entries were still single-model wrappers with basic tool use. HandSpeak AI won partly on demo impact (sign language is visually compelling).
- **2026 explicitly demands agents.** The curated challenges all specify multi-step workflows with human handoffs. Training Ledger's 9-agent architecture with typed contracts and durable orchestration is significantly more sophisticated than anything shown in previous years.
- **Wildcard risk:** Judges may unconsciously favour entries that respond to a curated challenge (clearer “buyer” signal). Training Ledger must emphasise: the user IS the buyer, the market is quantified, and the agentic design is deeper than most curated-challenge responses will achieve.

Comparison with Likely 2026 Curated-Challenge Entries

The strongest curated challenges for 2026 (based on clarity, buyer, and agentic fit) are likely:

- Challenge 1 (Late-Payment Resolution Agent) — clear SME buyer, simple chase workflow
- Challenge 9 (Compliant Rota Agent) — hospitality, scheduling is well-understood
- Challenge 10 (Tender Qualification Agent) — public procurement, high value
- Challenge 13 (Home Retrofit Sequencing) — climate/housing, government interest

Factor	Curated entries (typical)	Training Ledger (wildcard)
Named buyer	Enterprise/government (strong)	Consumer + coach (weaker signal)
Agentic depth	Usually 3-5 steps, basic tool use	9 agents, typed contracts, durable orchestration
Domain expertise	Often assembled team, may lack deep domain	Founder lives the problem daily
Demo viscosity	Synthetic data, mock integrations	Same constraint, but personal data makes it real
Responsible AI	Often an afterthought	Core architectural principle
Post-challenge path	Pilot customer conversation	Subscription product with clear unit economics

Overall Assessment

Training Ledger scores in the top tier of what this competition has ever seen on agentic design, responsible AI, and domain expertise. Its primary weakness is demo viscosity (no live wearable data in a 2-week sprint) and the B2C buyer signal (judges may prefer enterprise). If the demo lands — particularly the notes-parser → ghost-sets → evidence-card flow — this is a strong national finalist and a credible winner.

Probability of reaching national final: 75-85% (assuming competent presentation) **Probability of winning overall:** 25-35% (dependent on demo execution and judge composition)

The main competitive threat is a well-executed insurance or finance challenge entry with a named enterprise sponsor providing a letter of intent. Training Ledger’s counter: deeper agentic architecture, stronger responsible AI story, and authentic domain expertise that no assembled team can fake.
