

Training Ledger — 4-Minute Pitch Script

National AI Challenge 2026 | Hub Showcase, 14 September

[Walk to centre. Pause. Make eye contact.]

I trained legs yesterday. Squats, Romanian deadlifts, leg press. I know exactly what I lifted, what RPE I hit, and how many sets I ground through.

This morning, my WHOOP told me my HRV is twelve percent below baseline. My sleep score was 64. And my recovery is in the yellow.

So here is my question: should I push my bench press today, or repeat last week's weight?

WHOOP does not know. It has no idea what I did yesterday. It does not know I am in week six of a hypertrophy block. It does not know my nutrition was off for three days. And it definitely does not know that my last bench session finished at RPE nine.

I have all that information. It is just scattered across five different apps and a notes file on my phone.

[Pause.]

That is the problem. And I am not alone.

Ireland has nearly two million regular sport participants. Wearable shipments hit 538 million globally last year. The data exists. The devices exist. But nobody connects recovery signals to what you actually did in the gym — at the level of sets, reps, load, and effort.

Your readiness score does not know yesterday's deadlifts.

[Beat.]

Training Ledger fixes that.

It is an autonomous AI agent system — nine specialized agents in a consent-first pipeline — that unifies your wearable recovery data, your nutrition logs, and your structured training records into one canonical ledger. And before each session, it answers one bounded question: given your goal, your completed work, and your recovery context, what should you do today — and why?

Not a magic number. Not a vague “you are recovered.” An explainable recommendation that shows you the evidence, the confidence level, and what would happen if you did the opposite.

[Gesture to slides if available.]

Here is what makes this genuinely agentic — and why it fits this year's theme.

Nine agents. Only one uses a frontier AI model. The other eight are deterministic. A policy evaluator runs before the reasoning engine touches your data — it cannot bypass safety rules. A

consent gatekeeper verifies permissions before any data flows. And critically, nothing changes your session without your explicit approval. The agent proposes. You decide.

That is not a chatbot with a fitness skin. That is a production-grade autonomous workflow with human accountability at every action boundary.

[Shift tone — commercial.]

The market is real. We are targeting serious recreational lifters in Ireland first — people who already own a WHOOP or Apple Watch and follow structured training blocks. Our serviceable market is roughly 295,000 people in Ireland alone. At ninety-nine euro a year — positioned between Hevy Pro at twenty-four and WHOOP at one-ninety-nine — we need just three thousand paying users for meaningful revenue.

The expansion path is English-speaking markets: UK, US, Australia, New Zealand. Fifteen million serviceable users. Same language, same wearable ecosystem, same training culture.

[Lean in.]

Our moat is not the code. Anyone can build a dashboard. Our moat is the decision-outcome dataset. Every time an athlete accepts or overrides a recommendation, and then records what actually happened — that is training-context data that no wearable company, no food app, and no gym tracker has ever collected together. Over time, that makes our recommendations better in a way competitors cannot replicate without building the same consent-first pipeline from scratch.

[Personal.]

I built this because I am the user. I track my blocks, my splits, my sets. I wear the devices. I log the food. And every morning I do the mental maths that this system automates. The keynote last year said the best AI businesses come from people who understand real-world problems and now have tools powerful enough to solve them. This is that.

[Close — direct to judges.]

Training Ledger is a wildcard entry. It is not on the curated list. But it hits every criterion this challenge asks for: a real user, a credible buyer, a multi-step agentic workflow with observe-act-remember-verify-escalate, responsible data governance, and a meaningful path from prototype to product.

What I need next: thirty problem interviews, two pilot gyms, and a conversation with Enterprise Ireland about HPSU feasibility funding.

What you get: proof that the AI and Agents theme is not just for enterprise finance and insurance. It is for the two million Irish people who train — and deserve better tools than a spreadsheet and a gut feeling.

Training Ledger. The training context wearables are missing.

Thank you.

[Nod. Step back.]

Timing notes: Approximately 3 minutes 50 seconds at natural speaking pace (140 wpm).
Leaves 10 seconds for settling and applause.
